                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention relates to a method (MI) for determining the subtype of leukaemia cells and whether a patient sample contains leukaemia cells. The method comprises determining the expression profile of a group of markers in a patient sample. The method is useful for determining the presence of leukaemia cells, its types or subtypes, and for the preparation of a medicament for treating leukaemia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            29

reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (11). The polymotecrides are also used and in recombinant production of (11). The polymotecrides are also used in diagnostics as expressed sequence tags for identifying expressed sequence involving (II). It is useful in gene therapy techniques to restore normal cusful for to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful in medical imaging involving aberrant protein expression or biological activity. The polypeptide and polymucleotide sequences have applications in facilitations of mutentions responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences. AA&64197-AA$94564 represent novel human diagnostic coding sequences of the invention. Note: The sequence data for this patent did not appear in the printed specification, but was obtained in the contract of the invention of the contract of the invention of the contract of the contract
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      CACTTTATTCTGATTACAGTGCATTGAATTTCTTA-GAACTCATACTATCTGTATACATG 525

```
The present sequence encodes a human leptin receptor gene-related protein (LRGRP). The cDNA sequence was first isolated in Incyte clone 492703 from (LRGRP) that cDNA library through a computer generated search for the hNT2 cell line cDNA library through a computer generated search for amino acid sequence alignments. The LRGRP protein has some homology to Saccharomyces cerevised proteins of Caenorhabditis elegans ORF C30B.2 and treat metabolic, reproductive and developmental disorders, whilst treat metabolic, reproductive and developmental disorders, whilst antagonists of LRGRP can be used to treatment of cancer or connective tissue disorders e.g. rheumatoid arthritis and Sjogren's syndrome. Polynucleotides which hybridise to the LRGRP nucleotide sequence can be used for detection
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ACTGACTITICITATGCTGGGATGTGCCTTAGAGGATTATGGCGTTTACTGGCCCTTATT 180

Specifically with and inhibite the expression of ADR27652. The ON promotees expression of ADR27652. The ON promotees expression of leptin receptors on the cell surface and may contain phosphorothioate bonds; 2'-O-methyl nucleotides and/or a contain phosphorothioate bonds; 2'-O-methyl nucleotides and/or a triethyleneglycol residue at the 3'-end. Also claimed are interfering RNA (TRNA) of 15-25 nt that hybridize specifically with ADR27672, and inhibit expression of OB-RGRP. Also claimed are fusion proteins (FPs) and their coding sequences comprising OB-RGRP or MY047 (thought to be a member of the OB-RGRP family, shares 68# homology with OB-RGRP), and a protein that is a donor or acceptor of energy e.g. luciferase or yellow fluorescent protein (YFP) for detecting compounds that modify the interaction between the leptin receptor and OB-RGRP proteins, which can be used to prevent or treat leptin-related disorders. ON, also related interfering RNA, are used for prevention and/or treatment of leptin-related disorders, e.g. cateoporosis (or other conditions involving reduced bone density); calcitication; obesity; diabetes; anorexia; disorders of sexual maturity, hemmatopolesis, anglogenesis, thrombus formation, regulation of immunity and inflammation, fetal development and cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        1006
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     331
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 300
                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to primers for synthesising full length cDNA clones. 830 cDNA molecules encoding a human protein have been isolated and nucleotide sequences of 5'- and 3'-ends of the cDNA molecules have been determined. Primers for synthesising the full length cDNA are useful for clarifying the function of the protein encoded by the cDNA. The full length clones were obtained by construction of full length enriched cDNA libraries that were synthesised by the oligo-capping method. The primers enable the production of the full length cDNA easily without any special methods. The present sequence was used as the representative sequence encoded by the clone. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in CD-ROM format directly from
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     180
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     211
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   151

The invention relates to primers for synthesising full length CDNA clones. 830 cDNA molecules encoding a human protein have been isolated and nucleotide sequences of 5'- and 3'-ends of the cDNA molecules have been determined. Primers for synthesising the full length cDNA are useful length clones were butained by construction of full length encoded by the CDNA. The full length clones were obtained by construction of full length enriched cDNA libraries that were synthesised by the oligo-capping method. The primers enable the production of the full length cDNA easily without any special methods. The present sequence is the nucleotide sequence of the 5'-end of a cDNA provided in the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in CD-ROM format directly from EPO Primers useful for synthesizing full length cDNA clones and their use 540 631 420 511 480 571 391 360 451 TATCTGTATACATGTGCACATGTGCGGCATTTTACTATGAAATTTAATATGCTGGGTTTTTT **AATACCTTTATATATCATGTTCACTTTAAGAAGACTTCATAAGTAGGAGATGAGTTTTA** TGGGAGCAGTGGTAGCACTTTATTCTGATTACAGTGCATTGAATTTCTTAGAACTCATAC rarcretaracarerecacarecescarrrracrareaaarrraararecreeerrrr GTCATTTTCCTTACAATTCAAGGGTTTTTCCTTATATTTGGAAGAGGAGATGATTTTAGG Ĥ Ota T, Nishikawa T, Isogai T, Hayashi K, Ishii S, Kawai Y; Wakamatsu A, Sugiyama T, Nagai K, Kojima S, Otsuki T, Koga Claim 2; SEQ ID NO 358; 1380pp + Sequence Listing; English. This invention relates to a novel primers useful for synthesising full length CDNA molecules that encode human proteins. Specifically, it refers to secretory or membrane proteins that are potential therapeutic agents/ target molecules in the field of medicine, and in particular genes encoding proteins that are associated with signal transduction, glycoproteins and transcription. The present invention describes a method for efficiently cloning a full length human cDNA from both the 5' and 3' ends using the oligo-capping method. This polynucleotide sequence is the 5' end of a representative human DNA cluster of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 180
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  151
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  GIGGCATTATCCTTCAGTGGGGCTATTGGACTGACTTTTCTTATGCTGGGATGTGCCTTA 120

Specifically, it refers to secretory or membrane proteins that are potential therapeutic agents/ target molecules in the field of medicine, and in particular genes encoding proteins that are associated with signal transduction, glycoproteins and transcription. The present invention describes a method for efficiently cloning a full length human cDNA from both the 5' and 3' ends using the oligo-capping method. This polymucleotide sequence is the 5' end of a full length human cDNA sequence of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             151

patient will respond to treatment with a FTI such as (B) -6-[amino(4-chlorophenyl) (1-methyl-1H-imidazol-5-yl)methyl]-4-(3-chlorophenyl)-1-methyl-2-(1H)quinolinone, monitoring the therapy of a patient, treating a patient with leukemia with FTI if the analysis indicates that the patient will respond. This sequence corresponds to a mone whose remaining the patient.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                479
                                                                             will respond. This sequence corresponds to a gene whose expression may be modulated in the presence of FTI.
                                                                                                                                                                                                                                 411

The invention relates to primers for synthesising full length cDNA clones. 830 cDNA molecules encoding a human protein have been isolated and nucleotide sequences of 5'- and 3'-ends of the cDNA molecules have been determined. Primers for synthesising the full length cDNA are useful for clarifying the function of the protein encoded by the cDNA. The full length clones were obtained by construction of full length enriched cDNA libraries that were synthesised by the oligo-capping method. The primers enable the production of the full length cDNA easily without any special methods. The present sequence is the nucleotide sequence of the 3'-end of a CDNA provided in the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in CD-ROM format directly from EPO
                                                                                                                                                                                                                                                                          their use

## SCORE OVER LENGTH SEARCHES

Attached is a score over length search. This search was developed to overcome limitations in most standard search systems which favor large sequences with high scoring, but lesser overall identity over smaller sequences with higher overall identity. This search is especially useful for relatively small nucleic acid or polypeptide target sequences (antisense, fragments, probes, primers, RNAi, epitopes, haptens, etc.) claimed functionally via a form of hybridization and/or identity language and having defined upper and lower polynucleotide and or polypeptide length limits.

The score over length search is performed by first running the query sequence using examiner-specified identity and polynucleotide or protein length limit parameters, and saving 65,000 hits and 0 alignments from each desired database. The resulting output is reformatted using a Microsoft Word macro and is imported into Excel. The summary table data are then sorted by the ratio of score of each hit sequence divided by its length and the accession numbers for all hits below the examiner's desired score over length parameters are deleted. The remaining accession numbers are used to pull the corresponding sequences from the databases into subdatabases enriched for good hits and the query sequence is re-run against these subdatabases to yield the final results.

The score over length cutoff for this search is 70%

Examiner Please Note: This cover sheet should be included when submitting results to be scanned.

TITLE OF INVENTION: Olignocleotides Which inhibit Expression of the OB-RGRP Protein
TITLE OF INVENTION: Olignocleotides which inhibit Expression of the CB-RGRP Protein
TITLE OF INVENTION: Olignocleotides of the OB-RGRP Protein
TITLE OF INVENTION: Between Proteins of the OB-RGRP Family And The Leptin Receptor
TITLE OF INVENTION: Between Proteins of the OB-RGRP Family And The Leptin Receptor
; FILE REFERENCE: FRAV2003/0005 US NP
